

For this sprint we tried to complete a previous user story (EB-4) as well as the remaining major user stories. A lot of these user stories revolved around the appointment booking process as well as some other useful provider features. Our planned velocity is much higher than the previous sprint (49 compared to 33) since we wanted to finish a majority of our high priority user stories before the end of our last sprint. Although we knew that the sprint velocity would be higher, we took into account that completing the entire backlog was within our limits. This is because a majority of these user stories could be done independently of the others (i.e. less downtime). Since a majority of these user stories are quite large, they took longer to finish which is why our chart begins to decline only near the end of the sprint. Although this was the busiest sprint for us, we managed to complete all of our assigned tasks. In the upcoming days before our release/presentation, we plan to spend some time discovering and patching some of the bugs that may be present.
