For this sprint we tried to complete a previous user story (EB-6) and also work on user stories dealing with the process of booking reservations and paying for them. Our burndown chart climbed up at the beginning since we believed that because we were working on a half-completed user story from the previous sprint, we could add more to our backlog. This was not the case as we have not completed all user stories planned for this sprint. Many of us lacked the time to work on these user stories due to other assignments and midterms. This is the reason in why our graph only begins to decline near the end of the sprint. Furthermore, we had some difficulty designing our schedule schema, which delayed some of our subtasks. For our sprint velocity it was relatively the same as last sprint. (35 previously, 33 for this sprint) We went with a similar velocity as last sprint since although we didn't finish all the user stories in the previous sprint, we believed less time would be needed to complete EB-6 (since we worked on it last sprint). Although we have not fully completed this sprint, we have still completed 4 of 5 stories, with good progress on the remaining story. The work completed in this sprint sets up a majority of the work needed for the next sprint. For future sprints, we aim to keep a similar or slightly lower velocity.
